Acknowledgment

This text would not be possible without the many students who asked questions, pointed out mistakes, or told me what I said that did not make sense during lectures or after reading my notes. In particular I want to thank Patrick Behne for catching many errors in a very early draft of my notes, and Logan Harbour for helping with the solutions to almost of the problems herein. I would also like to thank Dr. Jean Ragusa for allowing me to present a modified version of some of his problems from when he taught a course using Fortran.

I would also like to acknowledge the great technology of Jupyter notebooks for creating a means to express code in such a way as to interweave it with the reasoning behind it. I only hope that I could do the medium justice.
